

A: Image to OCR converter is a standalone application. If your intention is to utilize the functionality to convert to editable text in other software, you may be better off with a proper tool for image processing, such as an image processing software. Image to OCR converter can convert image files into editable text files and/or to a different file format, such as a PDF. Image to OCR converter supports converting to Word (docx), PDF (pdf), txt (txt), HTML (html) and so on. If your intention is to convert the text, your best option is to use a text detection and recognition software. Text detection is the process by which a computer program or software can discover and detect words, characters, lines, and paragraphs in an image. Text is the most common form of content used on the web and on the printed page. Text recognition is the process by which a computer program or software can determine what characters are within an image, and give you back a text string. OCR is the most commonly known text recognition system. You can use open source software such as Tesseract or Google Cloud Vision API or similar. Another option is to use a desktop application that can help you with this. A: ImagetoOCR offers the following features: Convert image files (.tif, .jpeg, .png, .jpg) to .txt, .doc, .rtf, .html, .htm, .xls, .csv, .pdf and other various file formats Detect text in scanned documents and convert it to a new image file. Text detection in images. Text recognition in images. We are going to explain the text detection feature later in the review. You can simply go to its official website and download the latest version of the software. It is also available for free in the Windows Store. How to detect text in an image? Images have areas that are filled with a solid color (black, white or a mix of these). These areas are known as a 'contrast regions' or an OCR regions. You can simply run imagetoOCR software in a Command prompt (cmd.exe) and hit F1 button. In the following image, you can see a grid of white color blocks representing OCR regions. If we open an image in Preview and switch to Image Trace

A: Try this, Search Google for Image to PDF converter. or Image to PDF Converter Q: How to get data from a text file? I have a text file with the following structure: Latitude: 90.000000, Longitude: -6.000000, 0:27, 1:00, 2:00, 3:00, 4:00, 5:00, 6:00, 7:00, 8:00, 9:00, 10:00, 11:00, 12:00, 13:00, 14:00, 15:00 Latitude: 20.000000, Longitude: -6.000000, 0:00, 1:00, 2:00, 3:00, 4:00, 5:00, 6:00, 7:00, 8:00, 9:00, 10:00, 11:00, 12:00, 13:00, 14:00, 15:00 Latitude: 20.000000, Longitude: -6.000000, 0:00, 1:00, 2:00, 3:00, 4:00, 5:00, 6:00, 7:00, 8:00, 9:00, 10:00, 11:00, 12:00, 13:00, 14:00, 15:00 Latitude: 10.000000, Longitude: -6.000000, 0:00, 1:00, 2:00, 3:00, 4:00, 5:00, 6:00, 7:00, 8:00, 9:00, 10:00, 11:00, 12:00, 13:00, 14:00, 15:00 I want to extract the coordinate pairs for each latitude and longitude and save them to a text file. So far I have the following code, which reads the text file as a list of dicts (does anyone have a better/easier way of doing this?). file_path = "positions.txt" f = open(file_path) a = (line.strip() for line in f) a = [dict(x.split(':')) for x in a] I have a completely written function that takes each line of the file (which are dicts in the form: {'lat': 90, 'lon f678ea9f9e
